FREE SELF-ASSESSMENT · 10 CHECKS

The Copilot Readiness Scorecard

Ten checks, answered yes / no / unsure. Count your yeses at the end. The premise is simple and uncomfortable:

Copilot finds every file your permissions let it find — which means an AI rollout is also a permissions audit, whether you planned one or not.

— Content & permissions (the risk half)

1 Broad sharing.

Do you know how much content is shared org-wide ("Everyone" / "Everyone except external users") — and is that number deliberate?

0

— No / don't know

1

— Partially, or informally

2

— Yes, and we could show evidence

2 Sensitivity labels.

Are sensitivity labels deployed AND actually applied to the content that matters — not just published and ignored?

0

— No / don't know

1

— Partially, or informally

2

— Yes, and we could show evidence

3 Permission reviews.

Has anyone reviewed site and file permissions in the last year, on purpose?

0

— No / don't know

1

— Partially, or informally

2

— Yes, and we could show evidence

4 Stale content.

Is there a plan for old content — archives, expired sites, the folder from 2016 — before an AI starts quoting it as truth?

0

— No / don't know

1

— Partially, or informally

2

— Yes, and we could show evidence

5 Ownership.

Does every active site have a known owner who could answer "who should see this?"

0

— No / don't know

1

— Partially, or informally

2

— Yes, and we could show evidence

— Adoption & agents (the value half)

6 Use cases.

Are your Copilot use cases prioritized by evidence of real work patterns — not by whoever asked loudest?

0

— No / don't know

1

— Partially, or informally

2

— Yes, and we could show evidence

7 Pilot design.

If you're piloting: does the pilot have named users, defined scenarios, and a way to measure whether it worked?

0

— No / don't know

1

— Partially, or informally

2

— Yes, and we could show evidence

8 Adoption support.

Is there training and support planned past the license purchase — the part that separates adoption from shelf-ware?

0

— No / don't know

1

— Partially, or informally

2

— Yes, and we could show evidence

9 Agent inventory.

If agents are being built (Copilot Studio or elsewhere) — do you know what exists, who built it, and what it can touch?

0

— No / don't know

1

— Partially, or informally

2

— Yes, and we could show evidence

10 Agent rules.

Are there rules for who may build agents and what they may access — proportional to what the agent can do?

0

— No / don't know

1

— Partially, or informally

2

— Yes, and we could show evidence

— What your count means

8–10 yes · Ready-ish. Pilot with confidence — and keep governance moving at the same speed as adoption, because agents raise the stakes with every new permission they hold.

4–7 yes · Exposed. Fix the top of the risk half first: broad sharing and labels. Every "unsure" above is something Copilot will answer for you in production if you don't answer it first.

0–3 yes · Not yet. Licenses won't fix this order of operations. Readiness work first — then the rollout gets to be the success story instead of the incident report.

— When you want it measured properly

This self-assessment gives you a directional read. The **Copilot & Agent Readiness Gauge** replaces it with evidence: a founder-led, fixed-price assessment with artifacts you keep.

\$5,000 focused · \$12,500 extended · 2 weeks (3 extended)

- ✓ Oversharing and permissions scan
- ✓ Prioritized, evidence-based use cases
- ✓ Agent governance gap list

Scope and price are published at imp0wer.com/assessments/copilot-ai-readiness/. Ask through the form and a founder calls you back within one business day — the first conversation is diagnostic, not a pitch.
